THE TRNG9803

The TRNG9803 is a hardware random number generator intended for demanding situations, and is typically run on game (Poker) servers or other demanding applications, where a verifiable external random number source is required.

The circuit is simple and have a very low (verified) failure rate. The product is always delivered with a coated circuit board, to prevent problems due to moisture. Soldered with old-style lead-soldering, the typical life-span exceed 30 years.

Software and connection

The TRNG9803 attach directly to the serial port of the PC. Note that a genuine (=working) serial port must be used.

The random numbers are retrieved and processed using a supplied software, that all customers must pay effort into including into the application. The bare hardware cannot be used directly; the software is an integral part of the product.

Due to its simplicity the unit is offered at a relatively reasonably price. A customer can ask to obtain a quote for a higher volume, and significant discounts can be obtained for special applications that are not game related.

You can request assistance, including help with software, at **"SALES"** <sales@trng98.se>
